## Social Web Studies

What kind of Collaboration is right for your business?

Hélio Teixeira New York, May 2010

## Collaboration in Social Media age

- The good news is that potential partners and ways to collaborate with them have both expanded enormously in number.
- The bad news is that greater choice has made the perennial management challenger of selecting the best options much more difficult.

## Collaboration in Social Media age

- Should you open up and share your intellectual property with the community?
- Should you nurture collaborative relationships with a few carefully selected partners?
- Should you harness the "wisdom of crowd"?

## Collaboration in Social Media age

- Different modes of collaboration involve different strategic trade-offs
- Companies that choose the wrong mode risk falling behind in the relentless race to develop new technologies, designs, products and services

### Collaborative Architecture

 All too often firms jump into relationships without considering their structure and organizing principles...

## Given your strategy...

- How open or closed should your firm's network of collaborators be? and
- Who should decide wich problems the network will tackle and wich solutions will be adopted?

#### The Four Ways to Collaborate

There are two basic issues that managers should consider when deciding how to collaborate on a given innovation project: Should membership in a network be open or closed? And, should the network's governance structure for selecting problems and solutions be flat or hierarchical? This framework reveals four basic modes of collaboration.

#### Innovation Bazzar

A place where a company can post a problem, anyone can propose solution, and the company choose the solutions it likes best.

Example: InnoCentive.com website where companies can post problems

#### Elite Circle

A select group of participants choose by company that also defines the problem and picks the solutions

**Example:** InnoCentive.com website where companies can post problems

#### Innovation Community

A network where anybody can propose problems, offer solutions, and decide which solutions to use.

Example: Linux open source software community

#### Consortium

A private group os participants the jointly select problems, decide how conduct work. and choose solutions

**Example:** IBM's partnerships with select companies to jointly develop semiconductor technologies

## Flat

**PARTICIPATION** 

Hierarchical

#### **GOVERNANCE**

Hierarchical

Flat

## Collaboration Networks

- Collaboration Networks differ significantly in the degree to which membership is open to anyone who wants to join;
- Collaboration Networks also differ fundamentally in their form of governance. In some the power to decide which problems are most important, how they'll be solved, what constitues na acceptable solution, and which solution should be implemented is completely vested in one firm in the network: the "kingpin".

## Open or Closed Network?

- In totally open collaboration everyone can participate. A sponsor makes a problem public and then essentially seeks support from na unlimited number of problem solvers, who may contribute if they believe they have capabilities and assets to offer. Ex.: Open Source software projects such as Linux, Apache, and Mozilla are examples of these networks;
- Closed Networks, in contrast, are like private clubs. Here, you
  tackle the problem with one or more parties that you select because
  you deem them to have capabilities and assets crucial to the
  sought-after innovation.

## Open or Closed Network?

 Discussions of collaborative innovation in both academic journals and the popular media often wrongly link "openness" only with "flatness" – and even suggest that open, flat approaches are always superior. The notion is deeply flawed, however.

## Open or Closed Network?

- The **costs** of searching for, screening, and selecting contributor grow as the network becames larger and can become prohibitive.
  - So understanding when you need a small or large number of problem solvers is crucial
  - Closed modes, obviously, tem to be much smaller than open ones.

# When you use a **closed mode**, you are making two implicit bets:

- 1 That you have identified the knowledge domain from which the best solution to your problem will come, and...
- 2 That you can pick the right collaborators in that field

#### However...

If you don't know where to look for solutions or who the key players (and have no way to find out), a **closed mode** is dangerous shot in the dark.

## The big advantage of an open network is:

- Its potential to attract na extremely large number of problems solvers and, consequently, a vast number of ideas.
- You do not need to identify either the best knowledge domains or the nost appropriate expert in those domains.
- You don't need to know your contributors. Indeed, the fact that you don't know them can be particularly valuable.

# **Open modes**, however, have their disvantages...

- Notably, they're not as effective as closed approachs in identifying and attracting the best players. That's because as the number of participants increases, the likelihood that participant's solution will be selected (especially for ambiguous problem) decreases;
- The best parties, therefare, prefer to participate in closed relationships;

## Another requeriment of open modes is...

- ...that participating in them must be easy
  - This is possible when a problem can be partioned into small, welldefinided chunks that players can work on autonomously at a fairly low cost.
    - Ex.: The inherently modular structure of the Linux open-source community allows software developers to create code for new features without touching other parts of the application.
- Of course, not all problems can be partitioned into small, discrete chunks.
  - Ex.: The development of radically new product concepts or product architectures is a integral task that has to be embraced in its entirety. In such cases, closed modes that provide na environment where collaborators can closely interact must be employed.

## Flat or Hierarchical Governance?

- The chief distinction between a hierarchical and flat form of governance is who gets to define the problem and choose the solution.
- In the hierarchical form, a specific organization has this authority, which provides it with the advantage of being able to control the direction of the innovation efforts and capture more of the innovation's value.
- In the flat form, these decisons are either descentralized or made jointly by some or all collaborators; the advantage here is the ability to share with others the costs, risks, and technical challenges of innovation.

### Hierarchical Governance is desirable...

 When your organization has the capabilities and knowledge needed to define the problem and evaluate proposed solutions.

## Google's Innovation Ecosystem

### Media companies, individuals

- Create informations
- Stimulate consumer interest foster community
- Provide delivery mechanism for targeted ads

Content Providers

Consumers

The Google Platform

Innovators

## ■ 132 million unique visitors per day (as of 11/2007)

- Search for information and reveal interest
- Consume targeted advertising
- Validate appeal and test performance and marketing of innovations
- Contribute ideas for improvements
- Become new products' commercial user

## Over 1 million companies and individuals

- Deliver relevant ad content to searchidentified users
- Generate vast revenue stream that supports Google
- Help monetize innovators' new offerings

Advertisers

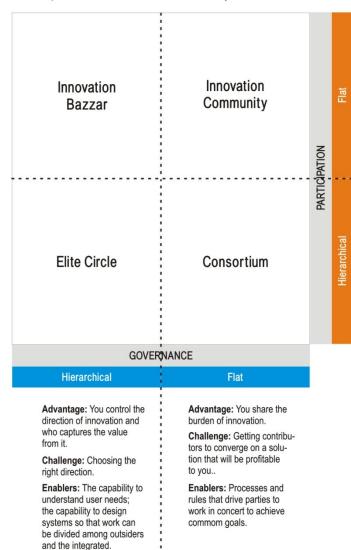

- Mashup creators, independent softwares vendors,
   Google engineers, open source community
- Togheter, make up a diverse productdevelopment network
- Develop new offerings that help keep consumers engaged and Google «sticky»
- Generate reveneu for themselves and for Google
- Extend value of Google's tools and technology

## Conversely Flat modes work well when...

 No single organization has the necessary breadth of perspective or capabilities.

#### How to Choose the Best Mode of Collaboration

When selecting a mode of collaborative innovation, managers need to consider the distinct strategic trade-offs of each mode. Below are some important advantages and challenges of the different approaches to collaboration, and examples of capabilities, assets, processes, and kinds of problems that make each easier to carry out.

Advantage: You receive a large number of solutions from domains that might be beyond your realm of experience or knowledge, and usually get broader range os interesting ideas.

**Challenge:** Attracting several ideas from a variety of domains and screening them.

Enablers: The capacity to test and screen solutions at low cost, informations plataforms that allow parties to contribute easily, small problems that can be solved with simple design tools, or large problems that can be broken into discrete parts that contributors can work on autonomously.

**Advantage:** You receive solutions from the best experts in a selected knowledge domain.

**Challenge:** Identifying the right knowledge domain and the right parties.

**Enablers:** The capacity to find unspotted talent in relevant network; the capability to develop privileged relationship with the best parties.

# Designing incentives – both financial and nonfinancial...

 ...that attract external collaborators is crucial with any of the four modes of collaboration.

## Open and Closed Innovation: The Future?

- Continued reform of the closed model: networked, platform innovators
- Closed innovators learning from open model
- Wider application of the open model from software
- Hybrid mixes of the open and closed models

### Thanks!
